Volume 45, no. 4, p. 1366–1369, 2007. In our paper we claim to report the first human case of Caulobacter sp. infection. Recently we discovered that the article might not represent the first published report of a human case of Caulobacter sp. infection. In a paper by M. Drancourt et al. (J. Clin. Microbiol. 38:3623–3630, 2000), 16S ribosomal DNA sequence analysis of a large collection of environmental and clinical unidentifiable bacterial isolates is presented. In table 1, p. 3625, a Caulobacter intermedius isolate from a clinical source is reported. Although the case is not described any further, that might represent the first report of a human case of Caulobacter sp. infection, whereas ours is the first to be reported in detail.

Page 1367, table 1, column 3, row 7 (cefoxitin results): “S” should read “R.”
